

Quicksys Introduces Disk Defrag for Windows Disk Performance

Powerful defragmenter and optimizer for demanding users.

Belo Horizonte, Brazil – August 19, 2009 – The Quicksys today announced the [Quicksys Disk Defrag](#), disk defragmenter and optimizer for Microsoft Windows®.

Disk Defragmentation reduces data access time and allows storage to be used more efficiently. With all the data organized, the head of reading, which is responsible for finding, reading and writing of files on disk need to move less, and the fragments of files are found more quickly. This is directly reflected in the performance and agility of the computer.

Quicksys Disk Defrag is high technology software that aims to rearrange the fragments of files on disk, to be continuously and in order, so that the performance and search speed of the disc increases. Besides defragmenting the disk, Quicksys Disk Defrag has a system called *QSICA* - Quicksys Intelligent Clusters Allocation - for clusters optimization.

QSICA is a set of intelligent algorithms capable of detecting the best location of the fragments of a file. Furthermore, *QSICA* tries to fill clusters at maximum extent with fragments of files already on the disc. As a result, the new files that are inserted in the disc does not try to put fragments in these clusters because they have no space, forcing the file to use free space of the disc, preventing further fragmentation. The process of optimization may take a longer time than other software, but ensures that your disk is organized with the files as best as possible and be prevented to a maximum of further fragmentation.

MAIN FEATURES

- It supports formatting NTFS (New Technology File System), FAT16 (File Allocation Table) and FAT32.
- Defragments the files on disk.
- Optimizes the files on the disk using the technology *QSICA*.
- Fast defragmentation and optimization.
- Works on any type of removable disk - floppy disks, USB (pen-drives), memory cards and so on.

- There is a minimal possibility of file corruption (Based on the standard defragmentation API by Microsoft).
- 15% of free space is not required.

ADDITIONAL FEATURES

- Dynamic graphical display.
- Custom drive map colors.
- Possibility to ignore large files.
- Possibility to ignore determined files and/or folders.
- Possibility to schedule disk defragmentation or optimization.
- Supports parameters.
- Show detailed information about the partitions.

ABOUT QUICKSYS

Quicksys was founded in 2006 and has more than 1 million users worldwide. Our main objective is become more productive your relationship with the computer. We create software to optimize operating system. You gain time. It's very simple to use. Quicksys tools has an intuitive understanding of human interfaces. A few clicks and whole process is concluded. Our mission is produce high quality optimization software with innovation features that improves the functioning of the entire system.
